## **Application Notes**

## Overview

The following Application files are a part of the Assembler package:

| File Name   | Description  |
|-------------|--|
| 1200def.inc | AT90S1200 I/O register and bit definitions. By including     |
|             | this file, all I/O register and bit names referred in the    |
|             | data book can be used in assembly programs.                  |
| 2313def.inc | AT90S2313 I/O register and bit definitions. By including     |
|             | this file, all I/O register and bit names referred in the    |
|             | data book can be used in assembly programs.                  |
| 2323def.inc | AT90S2323 I/O register and bit definitions. By including     |
|             | this file, all I/O register and bit names referred in the    |
|             | data book can be used in assembly programs.                  |
| 4414def.inc | AT90S4414 I/O register and bit definitions. By including     |
|             | this file, all I/O register and bit names referred in the    |
|             | data book can be used in assembly programs.                  |
| 8515def.inc | AT90S8515 I/O register and bit definitions. By including     |
|             | this file, all I/O register and bit names referred in the    |
|             | data book can be used in assembly programs.                  |
| m103def.inc | ATMEGA103 I/O register and bit definitions. By               |
|             | including this file, all I/O register and bit names referred |
|             | in the data book can be used in assembly programs.           |
| AVR100.asm  | Application note for EEPROM read and write access.           |
|             | Both random and sequential read/write access are             |
|             | implemented.   |
| AVR102.asm  | Contains application routines for data block copy Flash      |
|             | $\rightarrow$ SRAM and SRAM $\rightarrow$ SRAM.              |
| AVR128.asm  | Application example showing how to setup and control         |
|             | the Analog Comparator.                                       |
| AVR200.asm  | This application note contains implementation of code-       |
|             | efficient version of the following Multiply and Divide       |
|             | operations:  |
|             | • $8 \times 8 \rightarrow 16$ bit unsigned                   |
|             | • $8 \times 8 \rightarrow 16$ bit signed                     |
|             | • 16 x 16 $\rightarrow$ 32 bit unsigned                      |
|             | • 16 x 16 $\rightarrow$ 32 bit signed                        |
|             | • $8/8 \rightarrow 8$ bit unsigned                           |
|             | • $8/8 \rightarrow 8$ bit signed                             |
|             | • 16 / 16 $\rightarrow$ 16 bit unsigned                      |
|             | • 16 / 16 $\rightarrow$ 16 bit signed                        |
| AVR200b.asm | I his application note contains implementation of speed-     |
|             | encient version of the following multiply and Divide         |
|             | 0 $0$ $0$ $0$ $0$ $0$ $0$ $0$ $0$ $0$                        |
|             | • $16 \times 16 \rightarrow 32$ bit unsigned                 |
|             | • $8/8 \rightarrow 8$ bit unsigned                           |
|             | • $16/16 \rightarrow 16$ bit unsigned                        |

8-Bit **AVR** Assembler and Simulator

| File Name  | Description  |
|------------|--|
| AVR202.asm | <ul> <li>This application note contains implementation of some 16-bit arithmetic operations:</li> <li>16 + 16 bit addition</li> <li>16 + immediate 16 bit addition</li> <li>16 - 16 bit subtraction</li> <li>16 - immediate 16 bit subtraction</li> <li>Compare two 16 bit variables</li> <li>Compare 16 bit variable with 16 bit immediate</li> <li>Negate a 16 bit variable</li> </ul> |
| AVR204.asm | <ul> <li>This application notes supplies the following BCD arithmetic routines:</li> <li>Binary 16 to BCD conversion</li> <li>Binary 8 to BCD conversion</li> <li>BCD to Binary 16 conversion</li> <li>BCD to Binary 8 conversion</li> <li>2 Digit BCD addition</li> <li>2 Digit BCD subtraction</li> </ul>  |
| AVR220.asm | This application note shows how to sort a block of data in SRAM using the code efficient Bubble Sort Algorithm.  |
| AVR222.asm | This application note shows an example on a moving average filter.   |
| AVR300.asm | This application note shows an implementation of an I2C master in a single master system.  |
| AVR302.asm | This application note shows an implementation of an I2C slave.   |
| AVR304.asm | This application note implements a half-duplex software UART.  |
| AVR305.asm | This application note implements a polled half-duplex software UART.   |
| AVR400.asm | This application note shows how to use the Analog Comparator to implement a low-cost ADC.  |
| AVR401.asm | This application note shows how to use the Analog<br>Comparator to implement a dual-slope-alike ADC.   |
| AVR910.asm | This application note shows how to implement a simple In-System Programmer.  |

All "AVRxxx.asm" files contains runable example/test programs for demonstration and verification of the implementations.
